## LAKE SUPERIOR BATHYTHERMOGRAPH DATA

George A. Leshkevich

Water temperature profiles for a longitudinal cross section of Lake Superior were collected aboard vessels operated by the United States Steel Corporation during the 1972-73 and 1973-74 winter seasons. Seven cruises were made during this period, four during the first winter season and three during the second. This information was collected as part of the Great Lakes Environmental Research Laboratory's participation in the program to examine the feasibility of an extended navigation season on the Great Lakes and the St. Lawrence Seaway.

The temperature profiles were made with a portable expendable bathythermograph system and were taken at 30-minute to 1-hour intervals, resulting in 24 to 45 measurements per cruise. Temperature profile data from the surface to a maximum depth of 200 m (656.16 ft) is presented in tabular form for each cast.

### 1. INTRODUCTION

This report presents water temperature profile data collected across Lake Superior as part of the Great Lakes Environmental Research Laboratory's participation in the multi-year demonstration program to extend the navigation season on the Great Lakes and the St. Lawrence Seaway. Water temperature profiles were taken in the months of December, January, and February during the 1972-73 and 1973-74 winter seasons.

Temperature measurements were made using an expendable bathythermograph (XBT) system and were taken from ore carriers of the United States Steel Corporation's Great Lakes Fleet. This report describes the instrumentation and methods used in collecting the temperature profiles and presents an edited version of this data in tabular form.

---

<sup>1</sup> In April 1974, the Limnology Division, Lake Survey Center, National Ocean Survey, was transferred to the Great Lakes Environmental Research Laboratory of the Environmental Research Laboratories. Reference is made to Lake Survey Center since this work was initiated and conducted under that organization.

## 2. DATA COLLECTION

### 2.1 Sampling Program

It was the express purpose of this program to collect water temperature data across Lake Superior beginning during the time of fall overturn and continuing for as long as possible thereafter. To reach this objective, a sampling program was initiated to take water temperature profile measurements across the lake at periodic intervals. These intervals were affected by weather conditions as well as ice conditions and ship schedules but in general were approximately 2 weeks in length.

Seven cruises were made during the two winter seasons (see table 1). A cruise, usually taking 2 or 3 days, is defined as the time period required for a vessel to transit the lake either in an eastward (downbound) direction from Duluth or Two Harbors, Minn., to the locks at Sault Ste. Marie, Mich., or westward (upbound) from the Soo locks to Two Harbors. The sequence of the XBT casts varied depending on whether one or two persons made the cruise (see table 2 for dates and locations of XBT casts). During the four cruises of the 1972-73 winter season, the casts were made consecutively on a 24-hour basis, while those of the 1973-74 winter season were made in two segments, half of them being taken upbound and half taken downbound, with an area of overlap abeam of the Keweenaw Peninsula. The cruises were made aboard commercial vessels following the Lake Carriers' Association's recommended shipping route (see figure 1). It should be noted, however, that the courses and subsequently the station sites are not the same for all cruises.

### 2.2 Equipment

The water temperature profiles were taken by means of a portable XBT system and were continuously recorded in degrees Celsius from the surface to the bottom or to a maximum depth of 200 m (656.16 ft) for each station. A Sippican Expendable Bathymeterograph Recorder, model MK 2A-1, with a KOR 12 shallow water modification kit was used, coupled with a model LM 3-1 hand held launcher and Sippican T-10 XBT probes (see figure 2). Model MK 2A-1 has a temperature sensing range of -1.7°C to +35.5°C (28°F to 96°F), a temperature recording accuracy of  $\pm 0.2^\circ\text{C}$  ( $\pm 0.4^\circ\text{F}$ ), and a depth recording accuracy of  $\pm 2\%$  or 4.57 m (15 ft), whichever is greater.

### 2.3 Methods

The recorder was set up at a 120 volt a.c. power supply near the stern of the ship in an area that would be maintained at temperatures above 0°C (32°F). A 15.24 m (50 ft) electrical cord connected the recorder to the hand held launcher and thus provided some flexibility of recorder location. The procedure for making a temperature profile

Table 1. Bathythermograph Cruises, 1972-73 Winter Season

| Cruise No. | Date                 | Vessel         | Number of Stations |
|------------|----------------------|----------------|--------------------|
| 1          | 20, 21 Dec. 1972     | C. J. Callaway | 44*                |
| 2          | 27, 28 Dec. 1972     | P. R. Clarke   | 45*                |
| 3          | 15, 16 Jan. 1973     | A. M. Anderson | 30                 |

| 1973-74 Winter Season |                      |                |     |
|-----------------------|----------------------|----------------|-----|
| 1                     | 19, 20, 21 Dec. 1973 | A. M. Anderson | 31* |
| 2                     | 10, 11, 12 Jan. 1974 | A. H. Ferbert  | 32* |
| 3                     | 22, 23 Jan. 1974     | P. R. Clarke   | 24  |

\* Due to malfunctioning probes, ice interference, or other factors, the actual number of stations with valid data differs slightly.

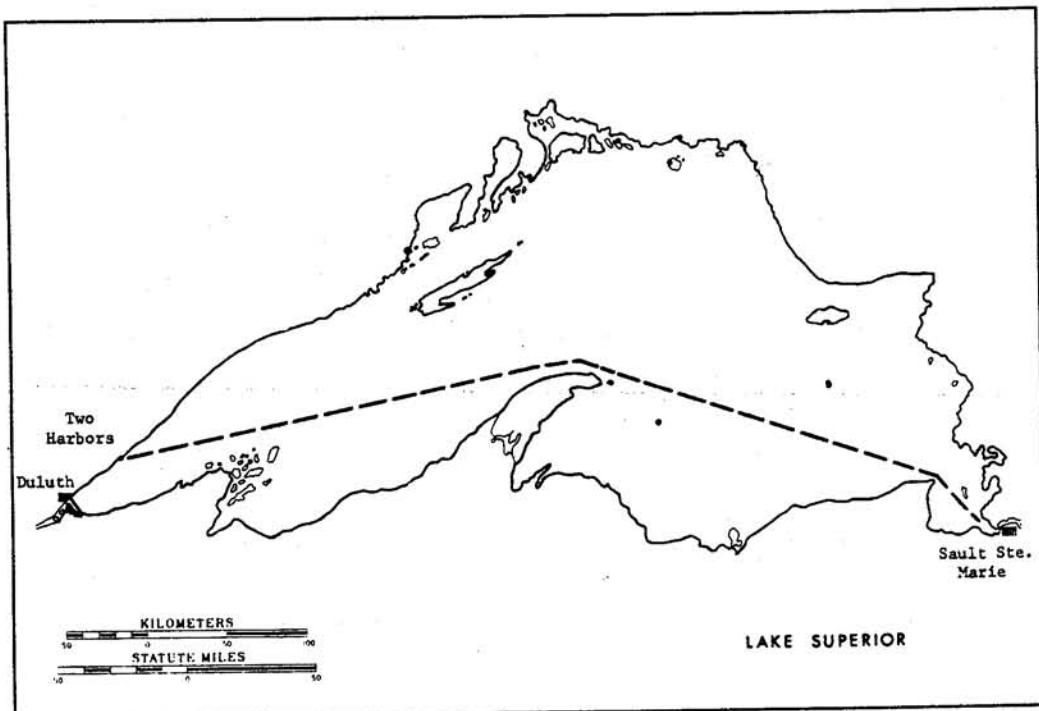

Figure 1. Lake Carriers' Association's recommended shipping route.

measurement consisted of loading an XBT canister into the hand held launcher, checking to see that the recorder calibrated at 16.7°C (62°F), taking the launcher to a convenient location on deck, and releasing the probe clear of the ship. When the release pin holding the probe in the canister is withdrawn, the probe falls from the canister and descends through the water unwinding a thin wire from the probe spool. The canister remains in the launcher with wire also unwinding from its spool. The two spools of wire, unwinding simultaneously, allow the wire to lie free in the water from the point of entry without being affected by the moving ship or the descending probe. The weighted nose of the XBT probe contains a temperature-sensitive thermistor, and the probe is spin-stabilized to assure a known velocity profile. A record of temperature in degrees Celsius and of depth in meters to a maximum depth of 200 m (656.16 ft) was continuously recorded as a graph on a calibrated paper chart for each cast (see figure 3).

Casts were made at 30-minute to 1-hour intervals, depending upon the detail desired for each cruise or portion of a cruise.

### 3. DATA REDUCTION AND PRESENTATION

#### 3.1 Data Reduction

After each cruise the ship's course and the station sites were plotted on a lake chart using information recorded from the ship's log. The temperature-depth profile for each station was abstracted from the graph to a coding form along with the cruise number, station number, latitude and longitude to the nearest hundredth of a degree, maximum depth at the station to the nearest meter, and the date. The temperatures were recorded to the nearest tenth of a degree for each meter to a depth of 100 m (328.08 ft) and thereafter for each 10 m (32.81 ft) of depth to a maximum of 200 m (656.16 ft). The information on the coding forms was subsequently punched on computer cards.

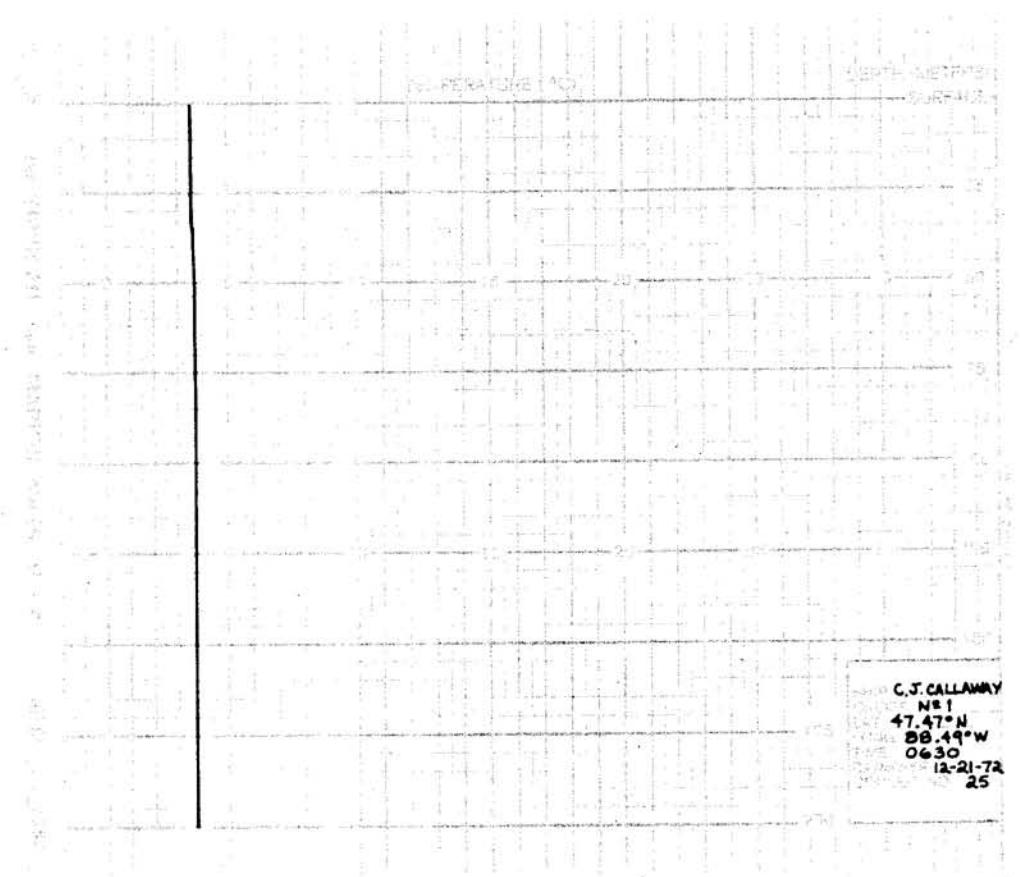

#### 3.2 Data Presentation

Because the data gathered during the seven cruises is too voluminous to reproduce in its entirety, only an edited version is presented in this report. A computer program was written to print temperature and depth only when the temperature changes by 0.1°C ( $\approx$  0.2°F) or more in a 1-m depth increment for the first 100 m and in a 10-m depth increment for depths from 100 to 200 m. Table 2 presents this data in tabular form. At station 25 of Cruise 1, 1972, for example, the temperature at the surface was 3.5°C, (38.3°F), changed to 3.6°C, (38.5°F) at 41 m (134.51 ft) and remained at that temperature (see figure 3). In table 2 this data is presented as follows: surface temperature 3.5°C, change in temperature to 3.6°C at 41 m, temperature at the deepest reading, which at this station is 200 m, 3.6°C.

#### 4. ACKNOWLEDGMENTS

This work was carried out under the general guidance of Dr. Frank H. Quinn, Head of the Lake Hydrology Group, and Charles Adams, formerly of the Lake Hydrology Group, Great Lakes Environmental Research Laboratory. Funding was provided under the Great Lakes-St. Lawrence Seaway Navigation Season Extension Demonstration Program.

The cooperation and hospitality of the captains and crews of the ore carriers of the United States Steel Corporation's Great Lakes Fleet is gratefully acknowledged. A special note of thanks goes to Captain Rankin and his associates at United States Steel who often on short notice granted permission and made arrangements for members of our staff to ride vessels of the fleet across Lake Superior.
